

PRACTICE QUESTIONS

1. Simple Greeting Function

Create a function `greet_user()` that prints:

Welcome to Python Programming

Call the function once.

2. Calculate Square

Create a function `square(num)` that accepts a number and returns its square.

Example:

Input: 6

Output: 36

3. Find Largest Number

Create a function `largest(a, b, c)` that returns the largest among three numbers.

Example:

Input: 10, 25, 15

Output: 25

4. Check Even or Odd

Create a function `check_even_odd(num)` that returns:

Even

or

Odd

based on the given number.

5. Calculate Total Marks

Create a function `total_marks(m1, m2, m3, m4, m5)` that returns the total of five subject marks.

Example:

Input: 80, 75, 90, 85, 70

Output: 400

6. Count Vowels

Create a function `count_vowels(text)` that returns the number of vowels in a string.

Example:

Input: "Python Programming"

Output: 4

7. Reverse a String

Create a function `reverse_string(text)` that returns the reversed string.

Example:

Input: "Python"

Output: "nohtyP"

8. Find Factorial Using Function

Create a function `factorial(n)` that returns the factorial of a number.

Example:

Input: 5

Output: 120

9. Check Prime Number

Create a function `is_prime(num)` that returns:

True

if the number is prime, otherwise

False

10. Sum of List Elements

Create a function `sum_list(numbers)` that returns the sum of all elements in a list.

Example:

Input: [10, 20, 30, 40]

Output: 100

11. Employee Salary Calculator

Create a function `salary_calculator(basic_salary)` that calculates:

- HRA = 20% of basic salary
- DA = 10% of basic salary

Return the total salary.

12. Return Multiple Values

Create a function `calculate(a, b)` that returns:

- Addition
- Subtraction
- Multiplication
- Division

Return all four values from a single function.

13. Use *args

Create a function `find_average(*args)` that accepts any number of marks and returns the average.

Example:

Input: 80, 90, 70, 60

Output: 75.0

14. Palindrome Checker

Create a function `is_palindrome(text)` that checks whether a string is a palindrome.

Example:

Input: "madam"

Output: True

Input: "python"

Output: False

15. Electricity Bill Calculator

Create a function `calculate_bill(units)` using the following conditions:

Units	Rate
First 100 Units	₹5 per unit
Next 100 Units	₹7 per unit
Above 200 Units	₹10 per unit

Return the total bill amount.

Example:

Input: 250 Units

Output: 1700
